3. Common issues of Caffe model conversion	10
4. Common issues of Tensorflow model conversion	12
5. Common issues of Pytorch model conversion	12

1. RKNN-Toolkit usage related questions

1.1. Why does channel_mean_value of rknn.config function have 4 values? If it is rgb image, does it still have 4 values?

channel-mean-value of rknn.config: used to set the preprocessing command line parameter. It includes four values (M0 M1 M2 S0). The first three values are mean value parameters and the last value is Scale parameter. If the input data have three channels (Cin0, Cin1, Cin2), the output data will be (Cout0,Cout1, Cout2) after preprocessing. The calculating process is as below:

Cout0 = (Cin0 - M0)/S0

Cout1 = (Cin1 - M1)/S0

Cout2 = (Cin2 - M2)/S0

For example, if need to formulate the input data into [-1, 1], you can set this parameter as (128 128 128);

If need to formulate the input data into [0, 1], you can set this parameter as (0 0 0 255).

1.2. When the input image is gray picture with single channel, how to set rknn.config interface?

Please refer to the answer of 1.1, when the input image is single channel, only "Cout0 = (Cin0 - M0)/S0" is used, so you can set as (M0, 0, 0, S0), while the values of M1 and M2 are not used.

1.3. How to set scale parameter of rknn.config function? That is to compress the input range into a certain scope, e.g. from (0-255) to (0-1).

Refer to the answer of 1.1.

1.4.rknn.lnference() interface error or stuck happened after multiple invoke

If the error log is similar as below:

```

```

Please update RKNN Toolkit to 0.9.9 or higher version.

1.5.rknn.inference() inferring speed slow issue

This issue has two kinds of phenomenon:

- 1) The speed of forward inferring test is slow, and some picture may take over 0.5s while testing mobilenet-ssd.
- 2) The time difference between model rknn.inference and rknn.eval_perf() is relatively big, such as:

Theoretical computing time(single picture)	1.79ms	8.23ms	7.485ms	30.55ms
Actual computing time(single picture)	21.37ms	39.82ms	33.12ms	76.13ms

There are two reasons for the issue of slow measured frame rate:

- Using the method of pc + adb to upload picture is quite slow, as it has high frame rate requirement for network such as 1.79ms theoretically.
- 2. RKNN Toolkit 0.9.8 and previous versions have BUG, which is already fixed in 0.9.9.

For more real measured frame rate, you can directly use c/c++ api to test on the board.

1.6. The first inference of RKNN Toolkit 0.9.9 version is very slow

RKNN Toolkit 0.9.9 version postpones the model loading to the first inference, so the first inference is relatively slow. This issue will be fixed in next version.

1.7.Fail to enable pre_compile=true when using RKNN Toolkit to convert model on the development board

Arm64 version RKNN Toolkit doesn't support pre_compile so far, if need to open pre_compile, suggest to use x86 version RKNN Toolkit to do the conversion.

1.8. Returned outputs of YOLO forward test is [array1, array2], the length is [10140, 40560], what is the meaning of the returned value?

The outputs returned by rknn.inference is a list of numpy ndarray, the size and quantity of each model output data are different, users need to look up the corresponding output and analytic rule of models by themselves.

1.9. RKNN Toolkit supported quantization method

RKNN supports two kinds of quantization mechanisms:

Quantization-aware training

Refer to Tensorflow quantization-aware training

(https://github.com/tensorflow/tensorflow/tree/master/tensorflow/contrib/quantize), which requires user should have some re-training experience of fine tune. Use rknn.build (do_quantization=False) after the quantized model is loaded through RKNN Toolkit, and now RKNN Toolkit will use the own quantization parameter of the model, so there is no loss on the quantization accuracy.

Post training quantization

When use this method, user loads the well-trained float point model, and RKNN Toolkit will do the quantization according to the dataset provided by user. Dataset should try to cover as many input type of model as possible. To make example simple, generally put only one picture. Suggest to put more.

Currently RKNN Toolkit supports three kinds of quantization methods:

✓ asymmetric_quantized-u8 (default)

This is the quantization method supported by tensorflow, which is also recommended by

Google. According to the description in the article of <u>Quantizing deep convolutional networks for</u> <u>efficient inference</u>: A <u>whitepaper</u>, the accuracy loss of this quantization method is the smallest for most networks.

Its calculation formula is as follows:

$$quant = round \left(\frac{float _num}{scale} \right) + zero _po int$$

 $quant = cast _to _bw$

Where 'quant' represents the quantized number; 'float_num' represents float; data type of 'scalse' if float32; data type of 'zero-points' is int32, it represents the corresponding quantized value when the real number is 0. Finally saturate 'quant' to [range_min, range_max].

$$range _max = 255$$

 $range _min = 0$

Currently only supports the inverse quantization of u8, the calculation formula is as follows:

$$float _num = scale(quant - zero _point)$$

√ dynamic_fixed_point-8

For some models, the quantization accuracy of dynamic_fixed_point-8 is higher than asymmetric_quantized-u8.

Its calculation formula is as follows:

$$quant = round(float _num * 2^{fl})$$

 $quant = cast _to _bw$

Where 'quant' represents the quantized number; 'float_num' represents float; 'fl' is the number of digits shifted to the left. Finally saturate 'quant' to [range_min, range_max].

range
$$_\max = 2^{bw-1} - 1$$

range $_\min = -(2^{bw-1} - 1)$

If 'bw' equals 8, the range is [-127, 127].

√ dynamic_fixed_point-16

The quantization formula of dynamic_fixed_point-16 is the same as dynamic_fixed_point-8, except bw=16. For RK3399pro/RK1808, there is 300Gops int16 computing unit inside NPU, for some quantized to 8 bit network with relatively high accuracy loss, you can consider to use this

quantization method.

1.10.If do_quantization is False during model conversion, will it do quantization? What is the quantization accuracy? (because the model is nearly half the size after conversion)

There are two scenarios. When the loaded model is the quantized model, do_quantization=False will use the quantization parameter of the model, for more details please refer to the answer of 1.9. When the loaded model is the non-quantized model, do_quantization=False will not do quantization, but will convert the weight from float32 to float16, which will not cause accuracy loss.

1.11. When structure RKNN model(invoking build interface), set do_quantization=False can build successfully, but set True will fail to build

The error log is as below:

```
T Caused by op 'fifo_queue_DequeueMany', defined at:

T File "test.py", line 52, in <module>
T ret = rknn. build(do_quantization=True, dataset='./dataset.txt')

```

It is because there is no data in dataset.txt, or the data format is not supported. Recommend to use jpg or npy.

1.12. "undefined symbol: PyFPE_jbuf" error occurs when install RKNN-Toolkit

The reason of the error is Python environment is not clean, for example, numpy is installed

in two different paths. You can re-build a clean Python environment and try again.

1.13. "Permission Denied" error occurs when install RKNN-Toolkit on Toybrick

The reason is there is no root authority. Need to add '--user' option for installation.

1.14. Does RKNN support model conversion with multiple inputs?

Currently it doesn't support model conversion with multiple inputs. This function is under evaluating.

1.15. What is the role of dataset during RKNN quantization? Why does quantization need to relate to dataset?

During RKNN quantization, need to find appropriate quantization parameters, such as scale or zero point. These quantization parameters should be selected according to the inference of the actual input.

1.16. Does rknn.inference() support multiple pictures input at the same time? Or support batch input?

Currently it doesn't support multiple pictures input at the same time.

1.17. When will it support to convert pytorch and mxnet model directly to rknn?

The function of converting Pytorch directly to rknn is under developing. There is no plan for mxnet so far.

1.18. Pre-compile model generated by RKNN-Toolkit-V0.9.9 can not run on RK3399Pro which NPU driver version is 0.9.6.

Pre-compiled model generated by RKNN-Toolkit-v1.0.0 can not run on device installed old driver (NPU driver version < 0.9.6), and pre-compiled model generated by old RKNN-Toolkit (version < 1.0.0) can not run on device installed new NPU driver (NPU drvier version == 0.9.6). We can call get_sdk_version interface to fetch driver version.

1.19. When I load model, the numpy module raises error: Object arrays cannot be loaded when allow pickle=False.

The error message is as follows:

```
E Catch exception when building RKNN model!

T Traceback (most recent call last):

T File "rknn/api/rknn_base.py", line 459, in rknn.api.rknn_base.RKNNBase.build

File "rknn/api/rknn_base.py", line 952, in rknn.api.rknn_base.RKNNBase._quantize

File "rknn/base/RKNNitb/app/tensorzone/workspace.py", line 231, in rknn.base.RKNNlib.app.tensorzone.workspace.Workspace.load_data

File "rknn/base/RKNNlib/RKNNnet.py", line 392, in rknn.base.RKNNlib.RKNNnet.RKNNNet.load_old_data

File "rknn/base/RKNNlib/RKNnnet.py", line 392, in rknn.base.RKNNlib.RKNNnet.RKNNNet.load_old_data

File "rknn/base/RKNNib/RKNNnet.py", line 392, in rknn.base.RKNNlib.RKNnnet.RKNNNet.load_old_data

File "rknn/base/pKNnlib/RKNnnet.py", line 392, in rknn.base.RKNNlib.RKNnnet.RKNnnet.load_data

File "rknn/base/pknnlib/RKNnnet.py", line 392, in rknn.base.RKNNlib.RKNnnet.
```

This error is caused by the change in the default value of the allow_pickle parameter of the load file interface after numpy is upgraded to 1.16.3. There are two solutions: one is to reduce the numpy version to version 1.16.2 or lower; the other is to update RKNN-Toolkit to version 1.0.0 or later.

2. Questions related with quantization accuracy

2.1. The accuracy doesn't match with original model after quantization, how to debug?

- > Firstly make sure the accuracy of float type is similar to test result of original platform:
 - (1) Make rknn.build(do_quantization=False) when the quantized model is loaded by RKNN Toolkit.
 - (2) Refer to 1.1 to set **channel_mean_value** parameter, which should be same as the parameter used for training model.
 - (3) Make sure the sequence of the input image channel must be R,G,B while testing.

 (Whatever the sequence of the image channel is used for training, it must be input by R,G,B while using RKNN to do testing)
 - (4) Set **reorder_channel** parameter in **rknn.config** function, '0 1 2' stands for RBG, '2 1 0' stands for BGR, and it must be consistent with the sequence of the image channel used for training.

> Accuracy test after quantization

(1) Use multiple pictures to do quantization, to ensure the stability of quantization accuracy. Set batch_size parameter in rknn.config (recommend to set batch_size = 200) and provide more than 200 images path in dataset.txt for quantization.

If the display memory is not enough, you can set batch_size =1, epochs=200 instead of batch_size = 200 for quantization.

(2) Accuracy comparison, try to use relatively big data set to do testing. Compare the accuracy of top-1, top-5 for classifying network, compare mAP, Recall of data set for checking network, and so on.

2.2. How to dump the output of each layer of network

Currently PC simulator supports to dump out data of each layer of network. Need to set an environment variable before executing inference script. The command is as below:

```
export NN_LAYER_DUMP=1
python xxx.py
```

After execution, tensor data file of each layer of network will be generated in current directory, and then you can compare with data of other framework layer by layer.

Note, some layers may be combined, for example, conv+bn+scale may be combined into one conv, in this case, need to compare with output of scale layer of the original model.

3. Common issues of Caffe model conversion

3.1. "Deprecated caffe input usage" error occurs during model conversion

It means this model is old version of caffe mode. Need to change input layer into below format.

```
layer {
    name: "data"
    type: "Input"
    top: "data"
    input_param {
        shape {
            dim: 1
            dim: 3
            dim: 224
            dim: 224
        }
    }
```

3.2. "Message type "caffe.PoolingParameter" has no field named "round_mode" error occurs during model conversion

round_mode field of Pool layer cannot be recognized, you can change it to ceil_model. For example, if originally it is round_mode: CEIL, then you can delete (ceil_mode is True by default) or change to ceil_mode:True.

3.3. "ValueError(""%s' is not a valid scope name" % name)" error occurs during caffe or other model conversion

The detailed error log is as below:

- T raise ValueError("%s' is not a valid scope name" % name)
- T ValueError: '_plus0_17' is not a valid scope name

In this case, it is because layer name '_plusxxx' is not allowed to use _ at the beginning.

Need to follow the naming rule of tensorflow:

```
[A-Za-z0-9.][A-Za-z0-9_.\\-/]* (for scopes at the root)
[A-Za-z0-9_.\\-/]* (for other scopes)
```

3.4. "Invalid tensor id(1), tensor(@mbox_conf_flatten_188:out0)" error occurs when Caffe version SSD conversion fails

Not support detectionoutput layer, you can delete and then change to CPU.

3.5. There should be three output tensor after Caffe version SSD model deletes detectionoutput, but actually only return two tensor by RKNN inference

The missing tensor is priori box. It is the same during training and inference stage, and for all inputs. In order to improve performance, RKNN-Toolkit optimized the relative layer in the model. If want to get the tensor of priori box, you can save the tensor of priori box, or use Caffe to do inference once in training stage.

3.6. "ValueError: Invalid tensor id(1), tensor(@rpn_bbox_pred_18:out0)" error occurs during py-faster-rcnn model conversion

Comparing with official code, need to change 'proposal' layer of prototxt as below:

```
layer {
    name: 'proposal'
    type: 'proposal'
    bottom: 'rpn_cls_prob_reshape'
    bottom: 'rpn_bbox pred'

top: 'rois'
    top: 'scores'
    proposal_param {
    ratio: 0.5 ratio: 1.0 ratio: 2.0
    scale: 8 scale: 16 scale: 32
    base size: 16
    feat_stride: 16
    pre_nms_topn: 6000
    post_nms_topn: 300
    nms_thresh: 0.7
    min_size: 16
}
```

```
layer {
    name: 'proposal'
    type: 'Python'
    bottom: 'rpn_cls prob_reshape'
    bottom: 'rpn_bbox pred'
    bottom: 'im info
    top: 'rois'
    python param {
        module: 'rpn.proposal_layer'
        layer: 'ProposalLayer'
        param_str: "'feat_stride': 16"

}
}
```

```
layer {
  name: 'proposal'
  type: 'proposal'
  bottom: 'rpn_cls_prob_reshape'
  bottom: 'rpn_bbox_pred'
  top: 'rois'
  top: 'scores'
     proposal_param {
     ratio: 0.5 ratio: 1.0 ratio: 2.0
     scale: 8 scale: 16 scale: 32
     base_size: 16
     feat stride: 16
     pre_nms_topn: 6000
     post_nms_topn: 300
     nms_thresh: 0.7
     min size: 16
  }
}
```

4. Common issues of Tensorflow model conversion

4.1. "AttributeError: 'NoneType' object has no attribute op" error occurs during Google official ssd_mobilenet_v2 model conversion

One possible reason is that input node is not correct. You can modify as below:

4.2. "Cannot convert value dtype (['resource', 'u1']) to a Tensorflow Dtype" error occurs during SSD_Resnet50_v1_FPN_640x640 model conversion

Need to update RKNN Toolkit to version 0.9.8 or higher.

4.3.On RKNN-Toolkit-V1.0.0, is the output shape of RKNN model converted from TensorFlow changed?

Versions prior to 1.0.0 will convert output shape from "NHWC" to "NCHW". Starting from this version, the shape of the output will be consistent with the original model, and no longer convert from "NHWC" to "NCHW". Please pay attention to the location of the channel when performing post processing.

5. Common issues of Pytorch model conversion

Currently RKNN Toolkit indirectly supports pytorch through ONNX, so need to convert pytorch to ONNX first. If issue occurs during conversion, please update RKNN Toolkit to the latest version first.

5.1. "assert(tsr.op_type == 'Constant')" error occurs during conversion

This issue is introduced after pytorch 0.4.5 version. In your model, if there is something like "x = x.view(x.size(0), -1)", need to change to "x = x.view(int(x.size(0)), -1)".

14
